Behaviour Analysis (<https://www.variot.eu/category/behaviour-analysis/>) Identification of IoT Malware Infections

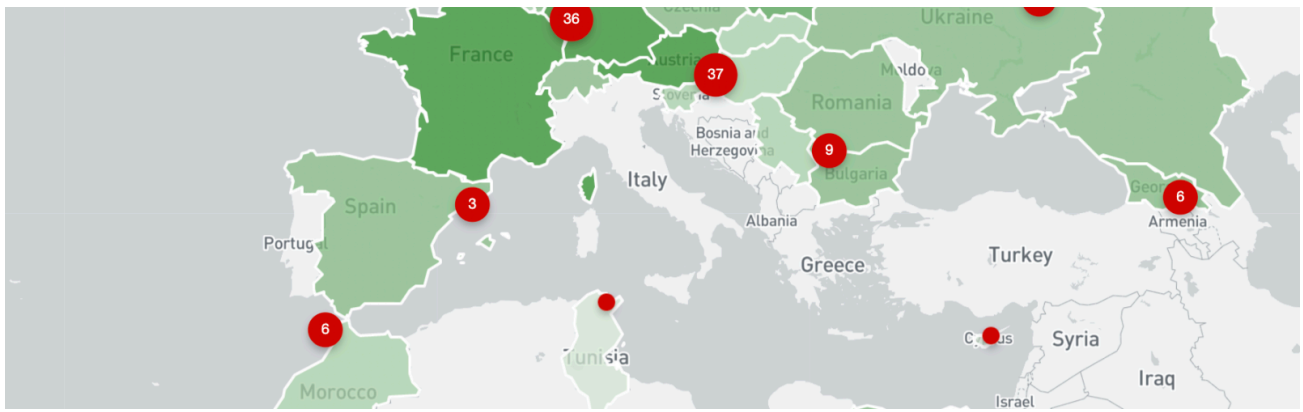

(<https://www.variot.eu/category/behaviour-analysis/iot-malware/>) Large-scale IoT Device Mapping (<https://www.variot.eu/category/iot-device-mapping/>)

As of the 19th of November 2021, the primary network runs 260 nodes with dedicated IP addresses for a total of 821 honeypots operating at once. The nodes are located in 88 countries, 331 unique /24's and 134 unique ASNs.

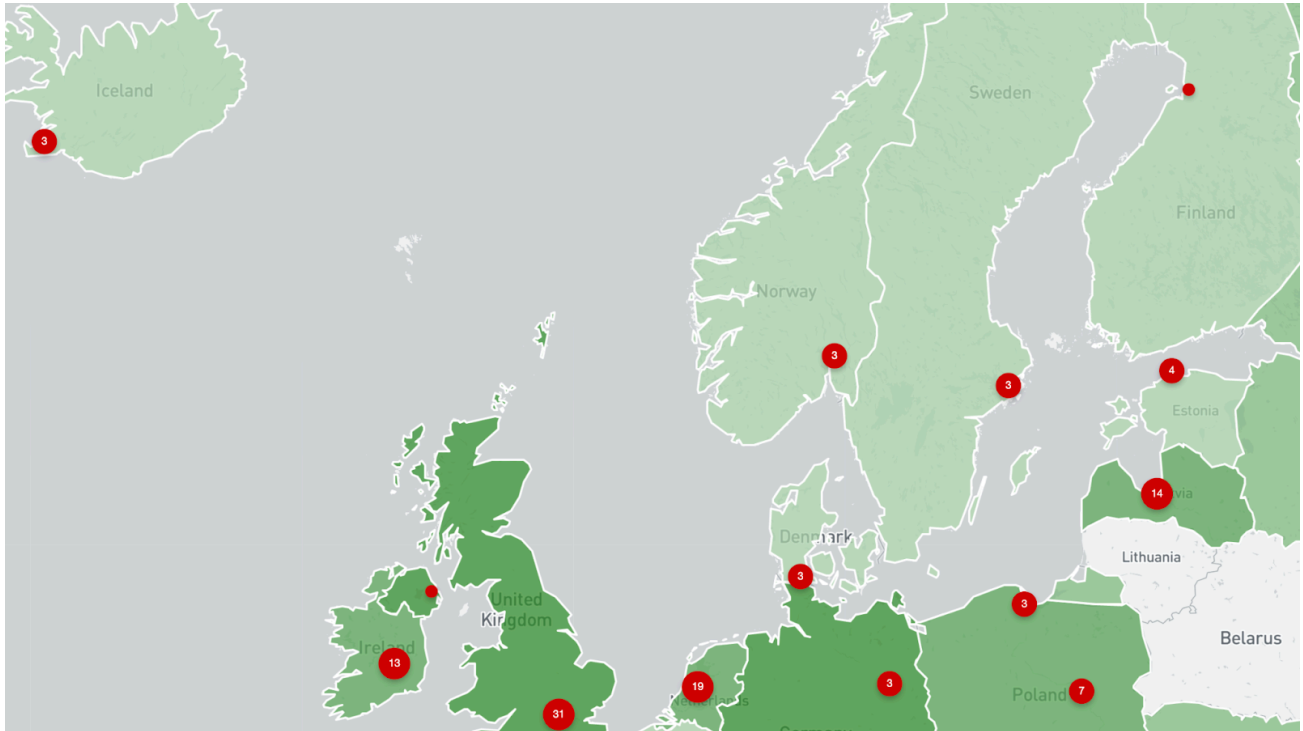

Primary honeypot network used by VARIOt (note: numbers are regionalized)

The honeypot network runs various open source and proprietary honeypots. This includes the cowrie honeypot and a proprietary IoT/Web honeypot, developed for the VARIOt project that classifies attacks seen by CVE, CVSS, targeted vendor and product, as well as mapping observed attacks to the MITRE ATT&CK framework.

Data from these honeypots is shared with 132 National CSIRTs covering 173 countries and territories and over 6000 organizations worldwide in Shadowserver's daily feeds (<https://www.shadowserver.org/what-we-do/network-reporting/>) via the Honeypot Brute Force Events (<https://www.shadowserver.org/what-we-do/network-reporting/honeypot-brute-force-events-report/>) report and Honeypot HTTP Scanner Events (<https://www.shadowserver.org/what-we-do/network-reporting/honeypot-http-scanner-events/>) report.

We have also developed a malware downloader framework that attempts to automatically decode URLs being used to serve malware. These URLs will soon also be shared daily through Shadowserver's free daily remediation feeds.

You can obtain VARIOt global statistics about infections seen by the honeypots (and other sources) on the VARIOt website hosted by CIRCL (<https://cra.circl.lu/opendata/variote/iot-exposed-infected-device-stats/>) and also on the European Data Portal (<https://data.europa.eu/data/datasets/infected-and-exposed-iot-device-statistics/?locale=en>).

Deployment of sensor nodes in Latin America and the Caribbean is supported by the sensores.lat project (<https://sensores.lat>) together with CEDIA (<https://www.cedia.edu.ec/>) and FRIDA (<https://programafrida.net/>).

Deployment of sensor nodes in Africa and the Indo-Pacific is also supported by the UK FCDO (<https://www.shadowserver.org/news/uk-foreign-commonwealth-development-office-funds-shadowserver-surge-in-africa-and-indo-pacific-regions/>).

If you would like to receive IP-specific information about events seen by our honeypots on your network or constituency seen by our honeypots please sign up with Shadowserver (<https://www.shadowserver.org/what-we-do/network-reporting/get-reports/>). If you have previously signed up for Shadowserver feeds, you automatically receive this data already should any honeypot event or malware infection be registered from your network or constituency.
